

Conference at the Safran Aerospace Museum : The key technologies and challenges of Safran Identity & Security

At 5pm on Wednesday September 14, the Safran Museum in Villaroche (Seine-et-Marne) will be welcoming François Perrachon - the Director of International Development at Safran Identity & Security - for a conference presenting the company's key technologies.

François Perrachon will look at the main challenges facing the Group's Security Division. He will then present certain flagship technologies, notably using the example of the "Airport of the future" project in Changi (Singapore). The project involves setting up a biometric identity-verification system using facial recognition, which will ensure maximum security for passengers, while also reducing waiting times. This will be the first time such a system has been installed in an airport.
